No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               N Geneseq 101002:*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The gene (AAT60739) encoding 1gG1 (AAW10550) can be subjected to sit directed mutagenesis in order to introduce one or more N-linked Bukaryotic host cells co-transfected with a vector carrying the mutated 1gG1 gene and with a vector that expresses an alphatic 1,3) fucosyltransferase capable of attaching sialyl-Le(x) groups at the glycosylation sites of the antibody molecule can be used in the prodn. of sallyl-Le(x)-modified antibody. Such an antibody has prodn. of sallyl-Le(x)-minified antibody. Such an antibody has therapeutic applns., e.g. in minimising inflammation and decreasing extravasation-dependent organ damage and/or clotting.
         extravasation-dependent adverse reaction; organ damage; clotting; adult respiratory distress syndrome; glomerular nephritis; ischaemic myocardial injury; immune reaction; septic shock; septicaemia; therapy; diagnosis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                79.7%; Score 293.2; DB 18; Length 2287; 88.2%; Pred.                                                                                                                                                                                                                                                The IgG1, in its nascent form, bears no sialyl-Lex side chains. The inventors designed a molecule including several such sites for attachment of sialyl-Lex side chains (see AAR2442, FT). The additional N-linked glycosylation sites are introduced at locations which impair complement fixing and Fr seceptor binding ability. They are preferably located in the CHZ region of the Ig molecule. Antibodies bearing multiple sialyl-Lex determinants are useful for disrupting undesirable interactions between cells or proteins. Bisrupting this interaction has therapeutic applications, for example, in minimising inflammation following tissue injury.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences for the variable regions of human monoclonal antibodies which are immunoreactive with human immunodeficiency virus-1 (HTV-1) envelope glycoprotein gpl20. These can be used in diagnosis and therapy of HIV-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human monoclonal antibody immunoreactive with human immunodeficiency virus-1 glycoprotein gpl20, useful for detecting HIV-1 in biological sample and providing passive immunotherapy to HIV-1 infected mammal.

Antibody TN11 reacts with the long form of human Tenascin-C (TN-C). The epitope recognised by TN11 is located inside domain C of TN-C. TN11 is therefore only capable of recognising TN-C isoforms containing domain C (cTN-C). TN11 is useful for detecting the presence of TN-C isoforms in vitro or in vivo for diagnosing pathologies expressing the cTN-C isoforms of TN-C. It is useful for the preparation of formulations for the treatment of human neoplasias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CTGGACAAGGGCTTGAGTGGATGGAAGGATCATGCCTATCCTTGGACTAGCAAATTACG 180

The present sequence encodes the heavy chain variable region of a human tumour-specific monoclonal antibody. Meoplastic cells selectively express antigodies can be produced that are specifically directed against tumour-specific antigens. The antibodies can be conjugated to cytoctoxic or cytostatic agents and used to selectively target cancer cells for the confidence of tumours. They can also be linked to diagnostic moieties that allow the imaging of neoplastic cells. Nucleic acids encoding human tumour-specific monoclonal antibodies can be used to express the antibodies with higher affinity or higher selectivity for tumour cells. The unclosed were produced by hybridomas that were generated by in vitro immunisation of human spleen cell cultures with breast carcinoma cells. The nucleic acid encoding the monoclonal antibody encoding the monoclonal antibody encoding the monoclonal antibody encoding the monoclonal antibody encoding the monoclonal antibody encoding the human monoclonal antibody encoding the region which was produced by LHI3 hybridoma cell line.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vector lambda FIX II was screened with the human VH1 family specific oligonucleotide (see AAQ22418). Phage clone lambda 49.8 was isolated and a 6.1 kb Xbal fragment contg. the variable segment VH49.8 subcloned into pNN03 to generate plasmid pVH49.8 An 800 bp region of this insert was sequenced. VH49.8 was found to have an open reading frame and intect splicing and recombination seignals, thus indicating that the gene is functional.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The resulting transgenic mice can be used for the production of heterologous (i.e. human) antibodies against specific antigens, this comprises immunising a mouse with a preselected antigen and collecting antigen binding heterologous human gamma immunoglobulins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A human placental genomic DNA library cloned into the phage vector lambda FIX II was screened with the human VH1 family specific oligonucleotide AAQ44184. Phage clone lambda 49.8 was isolated and 6.1kb Xbal fragment containing the variable segment VH49.8 was subcloned into pNNO3 to generate plasmid pVH49.8. An 800bp region of this insert was sequenced (AAQ44185) and VH49.8 found to have an open reading frame and intact splicing and recombination signals, indicating that the gene is functional.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

contains in its genome a transgence comprising in operable linkage human variable (V), diversity (D) and junction (J) genes, a human mu constant region gene (muCH), at least 2 different non-um human CH genes and secolated isotype switching sequences, where human mu and gamma switch sequences are located in closer proximity to each other than in the naturally occurring human immunoglobulin (Ig) locus, and where in lymphocytes of the mouse the transgene undergoes productive VDJ rearrangement and mu to gamma isotype switching by recombination between the human mu and gamma sequences, so that the mouse produces a serum containing Ig of at least 3 human heavy chain isotypes in response to antigenic stimulation. The transgenic mice can be used to produce human clipming climble in the transgenic mice can be used to produce human antigens. The MAD can be used in therapeutic or diagnostic applications. The transgenic mice can produce human MAD of multiple isotypes by undergoing isotype switching.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

                                                                                                                                                                                                                                                                                                                      This sequence encodes the VH49.8 gene from the human heavy chain V region and a member of the VH1 family. This gene was sequenced from the plasmid pVH49.8 which is used in a novel method of developing transgenic non-human animals capable of producing heterologues antibodise encoded by human immunoglobulin genes. Such transgenically produced monoclomal antibodies should alleviate the intrinsic immunogenicity of non-human immunoglobulins allowing the development of new in vivo applications.

                                  A novel composition has been developed which comprises an immunoglobulin [1g] having an affinity constant (Ra) of at least 2 multiply 10000000000 M-1 for binding to a predetermined human antigen. The present sequence represents the human VH1 gene VH49.8 isolated from a human placental genomic library lambda. Anti-CD4 antibodies from may be used in therapeutic and diagnostic applications, especially activity of CD4 cells and reduce undesirable autoimmune reactions, inflammatory response and remosplant rejection. Transgenic animals are capable of producing heterologous antibodies of multiple isotypes by is necessary for antigen-stimulated B-cell maturation and can give that encode and produce nor more subsequent heterologous isotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes transgenic animals that are capable of producing a heterologous antibody. The antibodies are isolated form a hybridoma, comprising B cells, that is obtained from a transgenic mouse having a genome comprising a human heavy chain transgene and a human light chain transgene. The B cells are fused to immortalized cells amount of an immunoglobulin that specifically binds digoxin or shinga-like toxin. B cells from transgenic animals can be used to generate hybridomas expressing monoclonal high affinity human sequence antibodies produced from the transgenic animals of the invention can be used to treat human diseases, e.g. autoimmune diseases, cancer, infectious diseases, transplant rejection, blood disorders such as coagulation disorders and other diseases.

Sequence 19, Application US/10091300
Publication No. US20030108545A1
GENERAL INFORMATION:
APPLICANT: Rockwell, Patricia
APPLICANT: Rockwell, Patricia
TITLE OF INVENTION: Combination Methods of Inhibiting Tumor Growth With a Vascular
FILE REFERENCE: 11245/46211 Growth Factor Receptor Antagonist
CURRENT APPLICANTON NUMBER: US/10/091,300
CURRENT FILING DATE: 2002-03-04
NS-10-151-882-9

1 Sequence 9, Application US/10151882

2 Sequence 9 Application US/10151882

3 Sequence 9. Application WS/20030059862A1

3 GENERAL INFORMATION:

4 APPLICATION NO Antibodies Against Tumor Necrosis Factor Delta (APRIL)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
